Introduction

User Instructions

Semantic Graph Prior

Decoded 3D Scene

Position a grey nightstand to the left of a wooden wardrobe with doors. Hang a white ceiling lamp with a wooden circle directly above a black double bed.

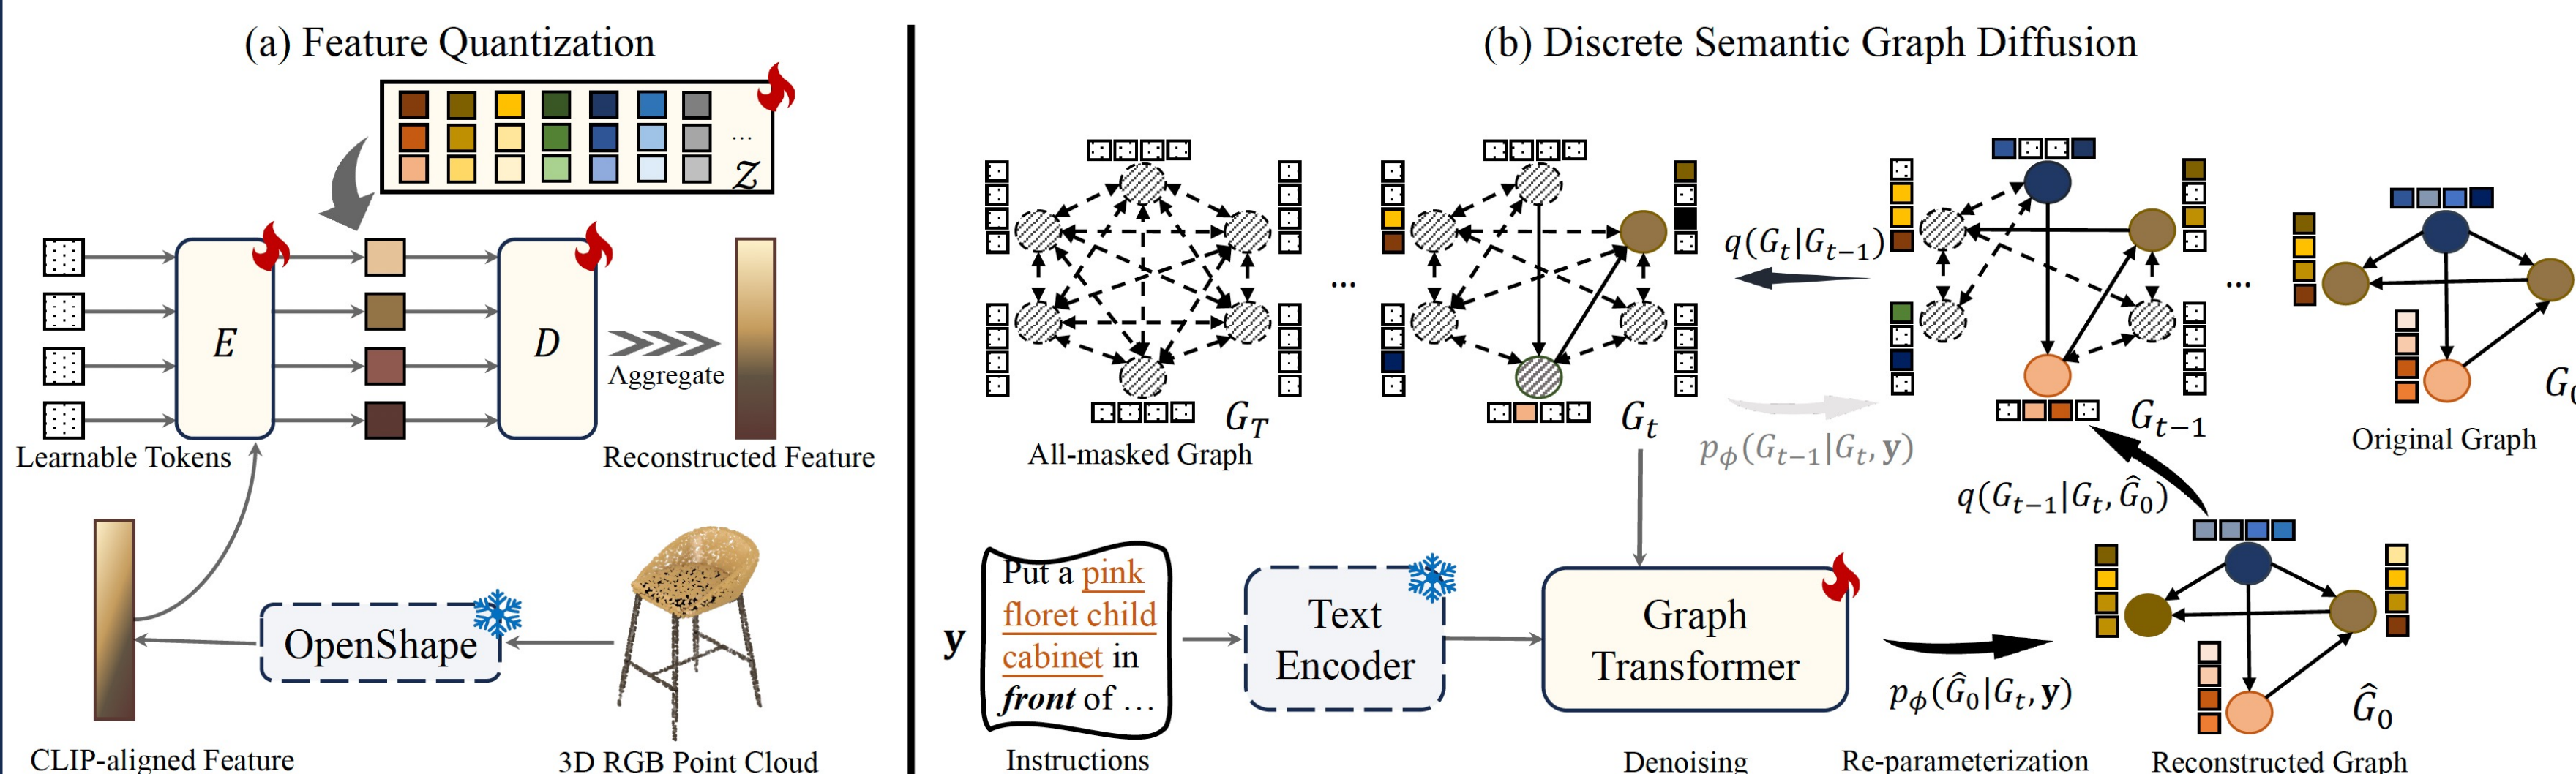

Object Feature Codebook

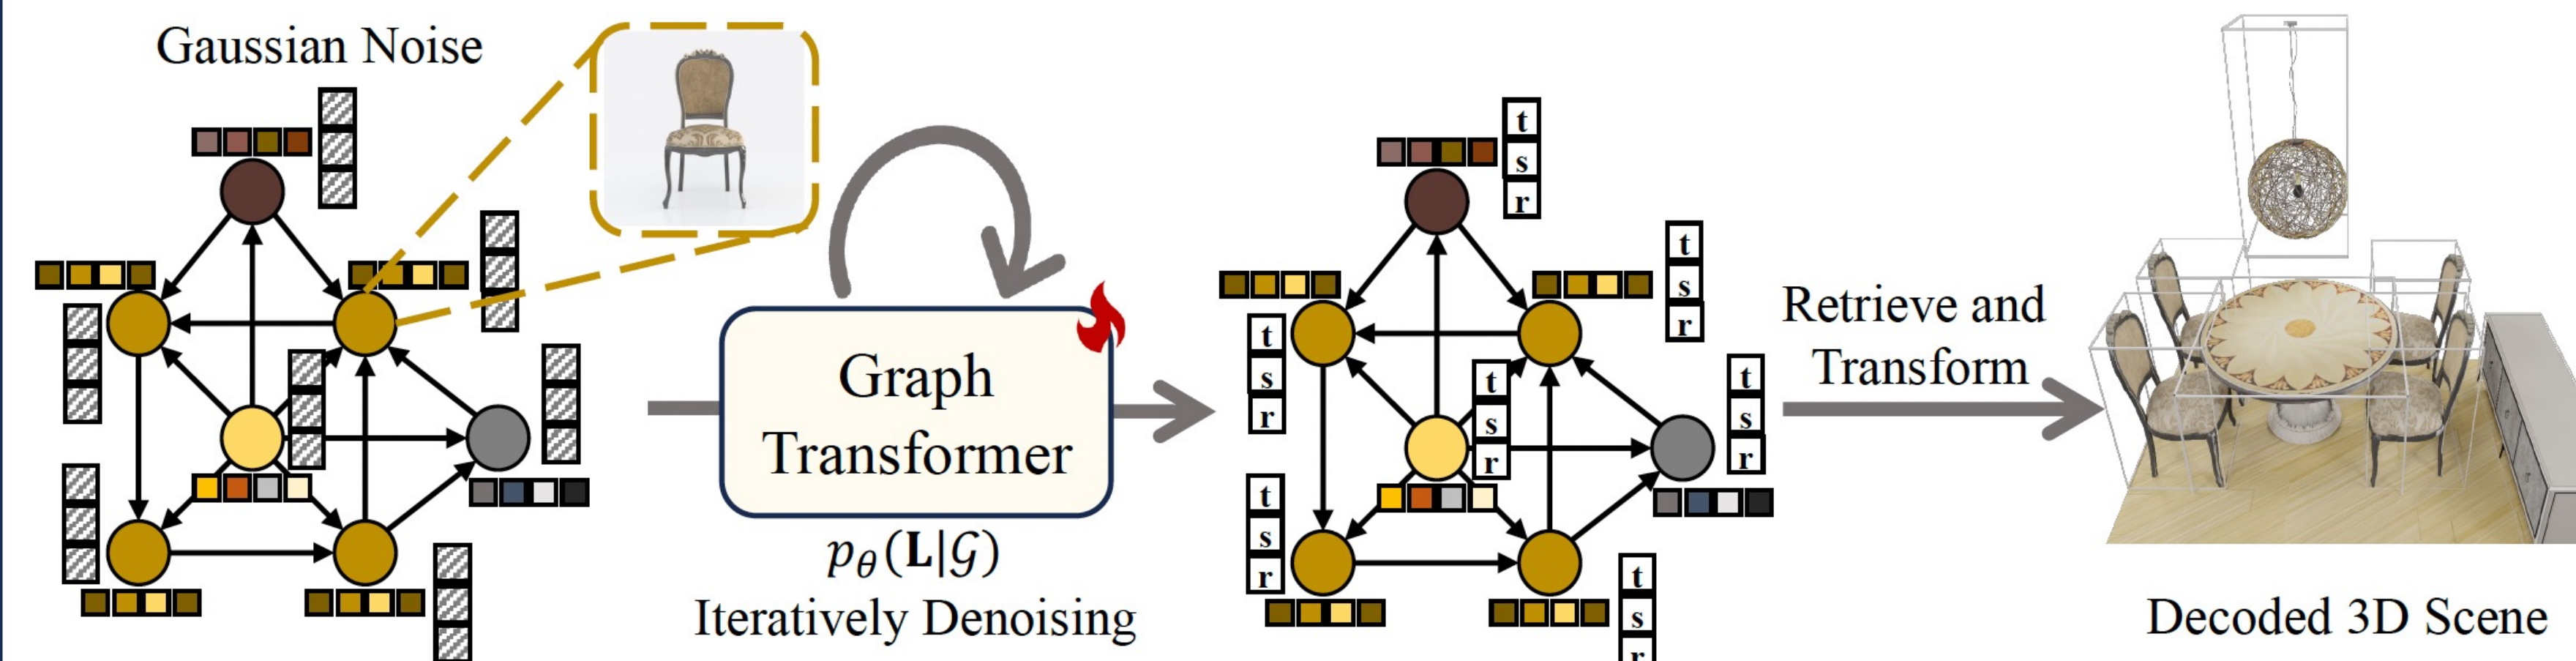

- **InstructScene** is a generative framework to **synthesize 3D indoor scenes from instructions**.
- It is composed of (1) **a semantic graph prior** and (2) **a layout decoder** to *improve the controllability and fidelity*.
- In the graph, each node is an object with **semantic features**; each edge represents a **spatial relationship** between objects.
- It proceeds to place objects in a scene by decoding precise **7 degrees-of-freedom attributes**.

Method Overview

- **Semantic Graph Prior**: Object semantic features are first **quantized**; A graph Transformer is then trained to learn the semantic graph prior by **mask-based discrete diffusion**.

- **Layout Decoder**: **Gaussian noises** are attached at each node, and are **iteratively denoised** by layout decoder to generate 7 DoF layout configurations: location, scale and yaw rotation.
